Assignment 5

To test that my code is sufficient, I tested each test harness and compared its outputs to the statically-linked binaries. Since these statically-linked binaries are the “official” versions of the executables, I can see if my test harnesses produce similar results. To test each individual function throughout the creation of my code, I simply created a main in a file to test and compare the functionality to an online calculator. Like for power\_mod, I was able to see that my output was correct because I checked with an online calculator.
